Between the three card sorts done with myself and my roommates, I found that some of my cards are not descriptive enough and ended up messing with the sorts. I had various cards like "App Inventor" and "Lego Mindstorm" but they became mixed up between class projects / side projects and other examples. Some of my cards were also a bit redundant, as technical skills and interests had some overlap, so I cut them duplicates such as interest in Java programming and Java from the final card sort. I ended up adding additional labels for my cards after the first sort in week 5 to have them more spread out. As a result, technical skills got split into another category called "tools". Overall, the card sorts did help me get a general picture of what to include content wise and helped organize ideas in specific categories.
